

a Cohort

Reproduced without modification. The benchmark assembles the first 1.5 hours after arrival and requires an ECG within about 90 minutes, so the cohort conditions on ECG presence.

MIMIC-IV-ED, a separate denominator rather than a pool this cohort was drawn from
425,011 adult ED stays, 205,465 patients, 85,209 held out for the acquisition-propensity diagnostic alone

b Nine pre-declared arms, nested input sets

Rows 1 to 5 are gradient-boosted trees at an identical 50-trial budget. Rows 6 and 7 use the benchmark's own published architecture. Every arm is trained at 5 seeds.

c Evaluation protocol
